

## **Brazil Recommendations (ECS ID-200, 210, and 201)**

Brazil made submissions for five areas of extended continental shelf.

### **3. Victoria-Trindade Ridge Region**

The Victoria-Trindade Ridge is located on the southern coast of Brazil and is composed of a number of flat-top seamounts. South of the ridge is the Santos Plateau and north is the Alborhos Bank. The Sub-commission determined the ridge a seafloor high that rises through both continental and oceanic crust, but is not morphologically continuous with the continental shelf. Instead they classified it as a discontinuous igneous feature. The Commission therefor recommended that Brazil make a revised submission.
