

Australia Recommendations (ECS ID-300)

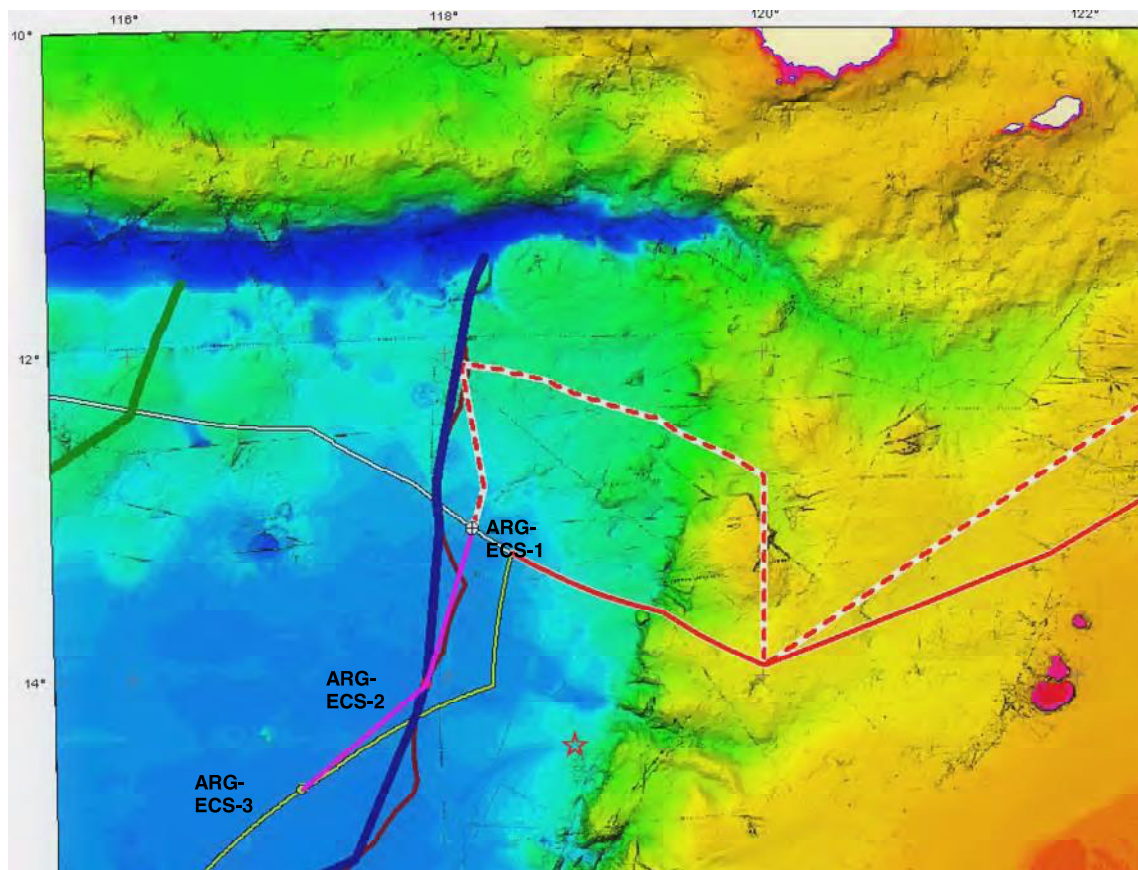

The nine regions contained in the Australian Submission (from Australian Executive Summary).

1. Argo Region

The Argo Region is located on the north west continental margin of mainland Australia. The region does not include any major submarine highs. Three fixed points were used to construct the outer limit line. One of the 3 fixed points ARG-ECS-3 is located on the 200 M line. The Commission did not agree with the method used to connect this point to the 200 M line as it creates area of continental shelf that falls outside of the continental margin as defined in article 76, paragraphs 4 and 7.

With the exception of this point the Commission agrees with the principles applied in establishing the outer limits. The Commission recommends that point ARG-ECS-3 and its respective connecting line be replaced by a point and a line that follow the outer edge of the continental margin. A new location for this point was provided in the recommendation. The Commission further recommends that Australia proceeds to establish the outer limits of the continental shelf in the Argo Region accordingly.

The outer limit line (violet) is based on the three fixed points, ECS- ARG-1,-2,-3. The formula line is shown in blue, the 350 M constraint line in dark green, the Australian-Indonesian Delimitation Treaty lines in red and stippled red and white, and the 200 M lines of Australia and Indonesia in black bordered light green and white, respectively (from Australian Executive Summary).
